

Hot-plugging USB storage devices.

I have a question about mounting USB storage devices. I have an Olympus digital camera, which I've been using happily for a while. I use `usbmgr` to load the `usb-storage` and `scsi` modules on demand, and a line in `/etc/fstab` allows me to mount it on `/camera` from `/dev/sda1`.

The problem is that I've just acquired a USB keychain memory drive. If that's the first device I plug in, it becomes `sda1`. I would prefer it each device was always mounted in the same place – `/camera` for the camera and `/keychain` for the keychain, for example. Is there any way of doing this with `usbmgr` or something else like `hotplug`?

I don't mind if the scripts auto-mount the devices, as long as Mere Mortal Users can unmount them.
