Hello. I was trying to compile the instable version of KDE (3.1.3) on my Sarge system. For that, I had to install GCC 2.95, as with gcc 3.3 I got some "sanity check problems". Since kdebase depends on kdelibs and that one depends on arts, I compiled arts and kdelibs without problems, but when I got to kdebase, after a day compiling (yeah, I have a kinda slow system) I got this:

```
-----  
else rm -f ".deps/kcmmiscwidget.Tpo"; exit 1; \  
fi  
/bin/sh ../libtool --silent --mode=link --tag=CXX g++ -Wnon-virtual-dtor  
-Wno-long-long -Wundef -Wall -pedantic -W -Wpointer-arith -Wwrite-strings  
-ansi -D_XOPEN_SOURCE=500 -D_BSD_SOURCE -Wcast-align -Wconversion -DNDEBUG  
-DNO_DEBUG -O2 -fno-exceptions -fno-check-new -DQT_CLEAN_NAMESPACE  
-DQT_NO_COMPAT -DQT_NO_ASCII_CAST -D_GNU_SOURCE -o  
kcm_keyboard.la.closure kcm_keyboard_la_closure.lo -L/usr/X11R6/lib  
-L/usr/lib -module -avoid-version -no-undefined rules.lo kcmlayout.lo  
pixmap.lo kcmmisc.lo kcmmiscwidget.lo -lXtst -lkio -lxxkbfile_pic  
/usr/bin/ld: cannot find -lxxkbfile_pic  
collect2: ld returned 1 exit status  
make[4]: *** [kcm_keyboard.la.closure] Error 1  
make[4]: Leaving directory  
`/usr/src/kde/kdebase/kdebase-3.1.3/obj-i386-linux/kxkb'  
make[3]: *** [all-recursive] Error 1  
make[3]: Leaving directory  
`/usr/src/kde/kdebase/kdebase-3.1.3/obj-i386-linux/kxkb'  
make[2]: *** [all-recursive] Error 1  
make[2]: Leaving directory  
`/usr/src/kde/kdebase/kdebase-3.1.3/obj-i386-linux'  
make[1]: *** [all] Error 2  
make[1]: Leaving directory  
`/usr/src/kde/kdebase/kdebase-3.1.3/obj-i386-linux'  
make: *** [build-stamp] Error 2  
Build command 'cd kdebase-3.1.3 && dpkg-buildpackage -b -uc' failed.  
E: Child process failed  
ronaldace:/usr/src/kde/kdebase#
```

Debian-User: Problem compiling KDE

Anyone knows why this may happen? Any help would really be appreciated.
Please CC to myself directly as I'm not signed up to the list.

Thanks in advance,

Ronald
