

Default install w/apache – how to create local web access?

To: <debian-user@lists.debian.org>

I have built a default debian box with apache, apache-ssl, and squirrelmail. I am creating accounts for family members who also want web page creation capability, but none of the accounts have web-like directories in their homedirs, like public_html or www.

Apache, apache-ssl, and squirrelmail were installed via apt-get install.

What change(s) do I need to make, and where, to permit local creation of web pages?

Thanks.

Scott
