Greetings:

Another RH to Debian convert question...

I'm used to rpm but clueless about apt, etc. I've mostly gotten the hang of dselect I think.

Can someone tell me the equivalent these commands, and/or what to run to get the desired result:

rpm -qa = show all packages installed?

rpm -q --whatprovides xxxx = tell me what package provided program
xxxxx

Thanks very much for the education as I convert to debian!

Scott
