Hi list,

here is a typical prob in debian. after particular days my debian show during booting * /dev/hda6 mounted 31 times without checking, check forcde* and it starts fsck.

now my question is that has debian programmed to check hard disk after 31 times mounting the disk ? if so how to change this so that it will check hard disk whenever find a problem like red-hat ?

thanks in advanced.

PS: please cc to me
