I assume you mean installing the java plug-in for your browser.

> *first using apt-get or aptitude what should I install?*

If you were using woody, things would be easy, just make your sources.list point to one of www.blackdown.org mirrors, and apt-get install j2re1.3.

As you are using sid, things get trickier. Packaged browsers are compiled using current sid gcc version which is 3.2, where packaged Blackdown j2re packages are still compiled using gcc 2.95, and they simply won't work together. In this case you can download, also from one of their mirrors, the latest tarball, this compiled using the same gcc version sid features, but check out, you will have to RTFM in order to install the plug-in manually.

<ftp://ftp.tux.org/packages/java/JDK-1.4.1/i386/01/j2re-1.4.1-01-linux-i586-gcc3.2.bin>

Remember to ldd the plug-in to check if your system lacks needed libraries!

Lastly, if you are not running on Intel, forget about this, for the moment. :)

Regards, Ismael
