

Debian-User: apac video card

apac video card

i am trying to configure xfree86 w/ dpkg-reconfigure to work w/ an old apac pci-bus video card. there is no apac driver available in the list of drivers so i selected the vga driver, 16-bit color, and the smallest screen size available. when gdm starts, the monitor flashes between blank screen and the console. apparently, xserver does not like my configuration. i read an xfree86-howto but this hasn't lead me to my misconfiguration.

does anyone have any suggestions as to what i may do to resolve this?
