| I'm running a standard debian binary kernel package
| (kernel-image-2.6.0-1-686) and it seems that I get a message written
| to the system log for every USB event. Since I have a USB mouse and
| keyboard, there are rather a lot of events.

|
| The messages looks like these (sorry for the wrapping):
|

| Jan 27 10:58:58 localhost kernel: evbug.c: Event. Dev: usb-0000:00:1f.2-2.2/input0, Type: 2, Code: 0,
| Value: -1

This is a problem. The workaround :

```
$ su
# rmmmod evbug
# rm /lib/modules/2.6.0-1-686/kernel/drivers/input/evbug.ko
```

Note that each time you upgrade the kernel-image package a new copy of evbug.ko will be provided. Remove the new one when that occurs. Also check the BTS to see when this issue is correctly resolved.

Yes, Java is so bulletproofed that to a C programmer it feels like being in a straightjacket, but it's a really comfy and warm straightjacket, and the world would be a safer place if everyone was straightjacketed most of the time.
