Hi all, new debian user here with some basic questions.

My resolv.conf file keeps getting reset to nothing (well, just the two comment lines warning me not to change things manually) everytime I reboot. I just plain don't have any idea what could be causing this. Ideas? Help?

To set resolv.conf, I su then type "echo 'nameserver 10.0.0.1'
|/sbin/resolvconf -a eth0" which takes care of the problem for one session.

How do I make this permanent?
