Hi list,

Using testing with kernel-2.6.6. Mostly use KDE.

Have a program "jbidwatcher" for ebay stuff, very cool, (especially the snipe feature).

I can start this program only by opening the dir where it is, then typing this:

```
java -jar JBidWatcher-0.9.3.1.jar
```

Is there a way to make this easier (faster)?

I have tried doing a 'create new link to application' on desktop but it won't work:

KDEInit could not launch 'java':

Could not find 'java' executable.

Ideas will be appreciated, and thanks a lot.
