To: debian-user@lists.debian.org

Hi, I have posted the same problem to debian-powerpc list but I have got no reply there yet. I think this is a problem general enough to post here, too.

I am trying to get vga-out to work on my iBook with reference to this site: <http://seb.france.free.fr/linux/iBookG4/iBookG4-howto-5.html#ss5.6>

When I ran debuild to compile the sources, it complained about the following:

```
> Now signing changes and any dsc files...
> signfile dri-trunk-sid_2004.02.28-2.dsc Michel Daenzer
> <daenzer@debian.org> gpg: skipped `Michel Daenzer
> <daenzer@debian.org>': secret key not available gpg: [stdin]:
> clearsign failed: secret key not available debsign: gpg error
> occurred! Aborting.... debuild: fatal error at line 787:
> running debsign failed
```

How can I get around this?

And, despite the error message, 3 deb packages are there in the parent directory of the directory in which I ran debuild, can I just use them?

Thanks.
