OK, I've just gone through something similar for a one user blog, but it should scale reasonably well, especially if blosxom (perl version) can be set up to use mod\_perl.

So get blosxom running.

Then install the wikieditish[1] plugin. Now you can make new posts by going to an existing node eg

<http://example.com/cgi-bin/blosxom/existent.wikieditish> to edit it

or to edit a new node

<http://example.com/cgi-bin/blosxom/non-existent.wikieditish>

With a bit of modifying of the templates you should be able to get "edit this page links" at the bottom of each post, and a little form in the page header or footer for the name of a new node that will take you to a new post which will essentially take you to the page

<http://example.com/cgi-bin/blosxom/page-name-I-typed-into-the-form.wikieditish>.

## Debian-User: Re: Setting up one blog per user

Of course, everything I've written here is completely untested apart from the initial installation of bloxom and configuring the wikieditish plugin so caveat emptor etc.
