If you're talking about plugins, they're system wide far as I know and have to be made by hand, unless there is a Debian package for it. For mozilla-firefox I did to download jdk 1.5 for a JAVA plugin and make a symbolic link from it's plugin directory to mozilla-firefox's

`/usr/lib/mozilla-firefox/plugins/the_plugin`

Extensions can installed directly per user by downloading, providing they support the Firefox version you have.

As it is I have two firefoxes right now. I'm not sure is it debian based problem or firefox, but my mozilla-firefox 'disappears' time to time. It can't be called nor is there a process for it. Is this known problem?

I have Sarge + Gnome and Debian packaged firefox

Antti
