Hello Everybody,

I've installed UML (User Mode Linux) and am able to use it. I can boot into it. Use it to access the net using a virtual network interface. The main machine allows the request to be forwarded and also masquerades. Till here I'm done.

How can I access the partitions of my real system from the UML ?  
I want to download the packages required for my UML os from some other machine => bring it back to my machine => then boot into UML and tell it, where on the original machine, the packages are located.

Any Ideas ??

rrs
