Hi all,

I want to install Debian. I m knew user of Debian.

I used Jigdo with WindowsXp for fetching a new DVD image of Debian 3.0

I get woody files from here

http://non-us.cdimage.debian.org/jigdo-area/3.0_r4-dvd/jigdo/i386/

and I begin fetching the iso image.

when he was fetching I saw a temporary

Debian....iso.tmp file of 4.2 Gbyte.

But when he finiched sucessfully. I didn't find an .iso

image for burning it on my DVD. I find just a

repertory of 4.2 GB whose name is

debian-30r4-dvd-i386-binary-1.

Do I have juste to copie all this repertory on my DVD and reboot my PC with this DVD for installing Debian.

Regards,

Benny
