It really seems to be the indicated bug. As you for sure noticed, Joey Hess suggests to upgrade mdadm.

Anyway, I wanted to suggest a link:

<http://unthought.net/Software-RAID.HOWTO/>

which helped me in at least partially understanding what is going on in RAID and what mdadm does.

Please keep me informed if/when udev+RAID works for you and how you installed it, without breaking your system.

Regards,
Hans-Joerg
