Dear my friends...

I am trying to have JRE and SDK on my debian because my boss push me to use Sun Java. I downloaded the JRE, converted it to deb package with alien like this:

```
alien -d -i ./j2re-1_4_2_08-linux-i586.rpm
```

it succeeded.

But once I installed it, I have a ridiculous thing. lookslike the java home directory and java class path have not been defined.

So how should I install my Sun JRE? Should I just define the path of java home directory and java class (lib) path? But how should I do that?

Thank you very much.

ps. I am a new comer in debian. Usually I use SuSE.
