> *First, I found out that Debian 3.1 does not include the CUPS server by default. So, I downloaded that via Synaptic. Then I downloaded hp-ppd (for my Okipage 14e, which uses HP Laserjet 4 emulation). Then, I found out that I need the gimp-print foomatic files, so I downloaded them as well as other gimp files dependent on them. I then went logged out and logged back in as root and configured the printer in Kprinter (KDE Control Center, Peripherals). Configuration was a total success, and at the end of it all I saw my Okipage printer listed at the top of the printers. So what's wrong? Well, when I tried to print a test page, it said: "print test successfully sent to the printer", but so far no actual printing. My guess is that I am just one step away from actually printing, but I am at a loss as to what is holding things up.*
