Hi,

some time ago I installed a little server at home to use it as firewall and mailserver. I got the mail using fetchmail, scanned with spamassassin and the delivered and filter with exim. Something that a lot of pages have explained. I'm using sarge in a P100 with 64Mb of ram. Little server!!!.

In general, allworks quiet well, and also I can have mail directly. But sometimes (and now, every day) I have frozen messages, and I don't know why, because this frozen messages exim cannot delivered it to a local account!!.

One typical log is:

1DwOmC-0003G3-4H-D

This message was created automatically by mail delivery software.

A message that you sent could not be delivered to one or more of its recipients. This is a permanent error. The following address(es) failed:

leo@localhost
local delivery failed

The following text was generated during the delivery attempt:

----- leo@localhost -----

Exim version 4.50 uid=103 gid=103 pid=12497 D=fb95cfd
Berkeley DB: Sleepycat Software: Berkeley DB 4.2.52: (December 3, 2003)
Support for: iconv() IPv6 GnuTLS
