Hi,

I've got apache2 installed, configured for all of my virtual domains and everything is running fine. Well, everything except for SSL.

I've created my cert with 'apache2-ssl-certificate' as well as by hand. Nothing I do ever seems to work, because as soon as I hitting port 443, I get an error and in the logs, this:

```
[Sat Jul 30 16:43:52 2005] [error] [client 127.0.0.1] Invalid method  
in request \x80j\x01\x03\x01
```

I've googled this but can't come up with anything very informative. Can anyone please help me?

Thanks,

Bryan
