Generally speaking, unless your lcd monitor is an aftermarket, big one that costs a couple of little red wagonloads of cash, 1024x768 is the limit.

This is because thats all the actual pixels there are on the screen itself. lcd's are not linear at any resolution like high vacuum swept electron beam crts are. Each pixel has a fixed location on the screens real estate.

[more snippage as its not revelant when the subject is a portables lcd screen]
