This is not really a question for `debian-www`; you would have been better off asking your question on `debian-user`. Cc set; please respect it.

Anyway. If you're looking for an operating system that you have to pay only once (if at all) and are allowed to use on all your systems, then almost every Linux distribution is a good option; the most well-known exception being current RedHat Enterprise versions.

After all, the nature of the license of most Linux programs requires that this is possible. Even when using RedHat, you are allowed to use at least parts of the system on another machine.
