Hi Jan,

that helps some -- got rid of most of the messages except one about shpchp, which is not listed in my /etc/modules, so don't know the origin. Unfortunately can't post my bootlog b/c bootlogd doesn't seem to want to run! I have the following /etc/default/bootlogd:

```
# Run bootlogd at startup ?
```

```
BOOTLOGD_ENABLE=Yes
```

... but still no /var/log/boot. Not sure what that's about; I noticed another thread from someone with a similar difficulty, no solution posted, not sure what's going on.

anyway, that was a great start, thanks!
