To: [debian-user@lists.debian.org](mailto:debian-user@lists.debian.org)

I got cups working with my hp 5740 (except for a 5min delay between jobs – that's another problem i still have). Now i'm trying to allow windows users to print to it via an smb share.

in the cups log, i see this:

```
get_jobs: resource name '/printers/lpstat -o printers' no good!
```

This is my smb.cnf:

```
[printers]
printing = cups
comment = All Printers
path = /var/spool/samba
printer admin = root
guest ok = Yes
printable = Yes
use client driver = Yes
browseable = yes
writable = no
create mode = 0700
print command = lpr-cups -P %p -o raw %s # using client side printer drivers
lpq command = lpstat -o %p
lprm command = cancel %p-%j
```

tia.
