Hey

I'm running a small LAN and is a bit lost in the question regarding a simple filesharing on a small LAN...

NFS: I don't get it. If anyone plugs into the lan and have a root-account they are on the share.

SMB: Works sometimes with linux, but often time-out with xsmbrowser/gnome and etc. It always works flawless with WinClients, but that's it.

I hate to said it/use this expression, but i'm looking for a simple MS peer-to-peer/small AD, just in Linux. I properly missed something...

/Lars
