Hi,

I was wondering if anybody had some experience on installing wordpress blogging software on a debian machine ?

configuring one wordpress setup through apt–get install is easy

but – from reading the docs and readme.debian, I noticed there is a specific way on debian the package is maintained

from what I can deduce – it is possible to install multiple blogs at once in the debian configuration – since it uses a domain specific config file for each separate blog

all the essential files making up the wordpress install are thereby isolated in /usr/share/wordpress, ideal for updating in one location by the apt repositories on a next apt–get update

is there any way to host multiple blogs through apt–get install on debian, on one domain ?

fi. <http://domain.com/blog1>, <http://domain.com/blog2>

without copying the wordpress files to each blog1 and blog2 directory ?

I mean – copying is a last resort, since that would mean reinstalling and fixing breakups every time a new version comes out

I also thought of making symlinks in each blog directory, to every file in question – but I'm not completely sure that's the proper debian way

if somebody has experience with this – please enlighten me :-)

thanks already,

greetings

frank
