Hi,

I have done a system upgrade from debian–stable to debian–unstable. After that more or less is working successful. But since i upgraded the system, I am not able to print anymore. All Pages come out on the Printer but empty. The Printer is not defect. Inc is full. On another Computer i can print on this Printer. There must be something wrong with the Print–Driver. Does anybody knwo something about that?
Printer is a Lexmark Z52.

greetz
