

# Apache+mod\_chroot+logrotate problem?

---

- 

Apache failed to restart this morning when logrotate kicked in. I got the following error:

[Sun Jan 8 06:25:39 2006] [notice] SIGUSR1 received. Doing graceful restart fopen: No such file or directory

I'm assuming this is because whatever file it wanted didn't exist inside the chroot jail. How do other people deal with this issue? And shouldn't the mod\_chroot (libapache-mod-chroot/stable 0.4-2) handle this sensibly by default?
