You mention students, so I will assume you are at a school. Any school that i can think of has computers, a network and an internet connection. With a reasonable Computer Science Department, most of those costs should be covered by them.

The CS Dept. may make the implementation of the system an indepenant research project or something to allow you class credit or 'extra credit'. And it may provide a means of students to get 'extra credit' by doing maintaiance.

I'm not sure why this would matter. You problem is a solved problem, so no one need to be Donald Knuth to make a suggestion as your not creating something that needs scalability like ebay.

Cheers,

Kev
