Hello friends:

My name is Ruben and i am from Spain.

I am administrator of an online weather server.

We have a weather station connected to the serial port of the server.

Weather station ONLY sends data, doesn't receive anything from PC.

At this moment we have one software attached directly to /dev/ttyS0, but we want test another Sotware.

What we have been testing is:

```
tee /dev/ptyt0 /dev/ptyt1 < /dev/ttyS0 > /dev/null &
```

And the attach one software to /dev/ttyt0 and the other to /dev/ttyt1

We have been testing but...some data is losen in /dev/ttyto and /dev/ttyt1

I don't understand why :(

Do you know if i could do this using another command?

Am i doing this Ok?

Please...we need some help, we have been some weeks fighting with it :(

A lot of thank's.

P.D. Excuse my poor English, but i don't explain very well.

Thank's
