The latter ones, since I am posting regarding a blackbox issue ;-)

Which means nothing. You don't specify... and since I'm not interested in beating details out of cluebies... I **asked**.

So how could I tell it to use bigger fonts on desktop and menus?

Blackbox couldn't care less about your "desktop". Look at the documentation for whatever application manages your "desktop" to determine how to control its fonts. Nautilus, ROX-Filer, idesk, and others are usually used for that purpose.

Blackbox manages windows. That's all it does. To that end, it decorates them with a title bar and other controls.

Taken from the Blackbox FAQ
<http://blackboxwm.sourceforge.net/BlackboxFAQ/NewQuestions>

**A1:* You can change the fonts on the window title bars by editing the current style file which you're using and changing the **font* or *window.title*font* resource. To find out what style file you're currently using, *grep* your Blackbox config file (usually *~/.blackboxrc* for *session.styleFile*).

As I stated above, found nothing on the *.blackboxrc* file (attached to this mail) regarding "font-size-on-desktop-environment" to tell it to do so.

The FAQ entry doesn't tell you to invent *blackboxrc* entries at random to search for, and then whine about them not being there. It tells you exactly what to look for to find out what style file blackbox is using, and then what to change in that style file to alter the fonts.

Re: Tiny fonts in Blackbox

It's really not a big deal, once you actually bother to read. Difficult, I know, but you'll have to learn how someday.
