Hi, Debian users.

I strongly suspect that my screen resolution is lower than it should be: everything appears very big.

Is there a way to check up the real performed resolution?

And a way to make it be what it should?

When I run 'dpkg-reconfigure -pmedium xserver-xfree86', the resolution displayed is never what I put: 1024x768.

I have Sarge 3.1 stable.

I got no help from the debian-laptop mailing list.

I hope someone can point me to the right way.

Thanks,
Rodolfo

xdpyinfo(1) is the traditional X utility for this:

```
digbyt@fujitsu:~$ xdpyinfo
.
.
screen #0:
print screen: no
-> dimensions: 1280x1024 pixels (369x295 millimeters)
resolution: 88x88 dots per inch
depths (3): 1, 8, 24
root window id: 0x2b
depth of root window: 8 planes
number of colormaps: minimum 4, maximum 6
default colormap: 0x21
default number of colormap cells: 256
.
.
```
