Sorry,

I have not been able to find the answer, even if I KNOW it must be a FAQ :(

I have a debian installation and I use a relatively high resolution monitor (1600x1200).

It works fine but it is convinced I have 75x75 DPI, so everything is **very** small.

Real resolution is about 110x110 DPI.

How can I convince xorg X server to use another setting?

I tried the monitor calibration process, but that didn't change anything.

xdpyinfo still reports:

..

dimensions: 1600x1200 (524x486 millimeters) <=== the real dimensions are (360x266 mm)

resolution: 75x75 dots per inch <=== the real resolution is about 110x110 DPI

..

what should I tweak?

TiA

Mauro
