Hi...

I'm a new user of this mailing list... with a very annoying problem with my kde. So, I use Debian Sarge and kde3.3.2. When I have open a window with several tabs... sometimes i get a error that close the complete window and I have reboot my task :(The backtrace tell me this:

sorry for this ;). i don't want it ... xD... but i have thought to be important. I have been looking for in google, but nothing... also I see that the backtrace say libqt, libstdc++, and any other library important for the base of system... Somebody know if have a any solution?? :(...

any indication will be well received...

Thank you for all and sorry for my english expresion ;)...

PD: I haven't reported the bug, because i read that i would write here ... it's correct??... ;)

Deivid

... somebody have any idea ??? :(this happen when i use konqueror with more than 4 ó 5 tabs... but either always is secure

thanks ;)
