I'm looking for a simple NTP client daemon to synchronize the time on my debian server. I'm testing openntpd but I've this error message:
adjtime failed: Invalid argument

Could someone help me or suggest something?
Thanks

"aptitude install ntp-server" and off you go.

I believe it's now called just `ntp'.

I know it's called a "server" and you want a "client" but there's not really much difference with NTP and the default configuration should be exactly what you want.

Indeed. Incidentally `openntpd' is also both a client and a server. Openntpd is OK but it seems that it was developed for a kernel whose time-tracking facilities are not as sophisticated as Linux's (at least they don't use them).

Stefan
