i can't remember how, but i was able to send mail to any email address from redhat useing "mail someone@xxxxxxxxxxx "  
how can i get this with debian ?

Do you mean something like this:

```
echo "this is a test." | mail -s "test" user@xxxxxxxxxxxx
```

You need to have a mail transfer agent (MTA) configured and running, if this shall work. The default MTA with Debian is Exim.

Which version of Debian (stable/testing/unstable) are you running? Is Exim or another MTA (postfix) installed and configured on your system?

i am using unstable. i tried exim. but after long time waiting, it's give me a dalivery failure notice. then now testing send mail. useing mail client with send mail. now i can send. but mail command is not working any more (i removed exim4)

Kind regards  
David
