Thanks a lot. Adding the extension entry to php.ini did the job.

Best Regards
Ernst

Hi All

Im trying to install php with mysql support without success.

My configuration:- Debian 3.1 stable- php 4.4.2 testing- mysql 4.1 testing

I cannot take php from stable since I must have php 4.4.

I have installed mysql, php4 and php4-mysql.If I run phpinfo, mysql no information about mysql is available.

Any ideas what I'm missing. Additional stuff to install, configuration?

EDIT /etc/php4/apache/php.ini
search for "extension=mysql.so"
and uncomments it

Best RegardsErnst
