I understand that to __edit__ MS word files, the only fully functional option is OpenOffice.

However, to just read properly .doc files that people email me thinking that its the only format around, what works? I need not just the text but collumns, tables, images, the works.

Is there a way to convert them to PS and view with gv?

Which DE (or WM) do you use? AbiWord and/or KWord also work, depending on the complexity of the documents.

Is "common sense" really valid?

For example, it is "common sense" to white-power racists that whites are superior to blacks, and that those with brown skins are mud people.

However, that "common sense" is obviously wrong.
