Thanks to Sven Arvidsson! I found the plugins SndStretch for xmms and Scizzor for both xmms and beep. Both are not packaged. They are easily compiled and at least SndStretch works fine. There is also a crossfade plugin for xmms in Debian. The drawback here is, that I'm not compatible with the UI of XMMS. It looks like a burlesque of a car radio, not like a normal program as e.g. rhythmbox.

Hi,

I know exactly what you mean. The UI of XMMS was one of the things that made me go looking for another player, years ago.

My favourite is Rhythmbox, but it doesn't have all the features you need.

– Cross-fading is a work in progress. See http://bugzilla.gnome.org/show_bug.cgi?id=130426

– I don't know of a plugin to change pitch. But there seems to exist GStreamer plugins for this (the backend for Rhythmbox) so presumably this functionality could be added. Maybe you could file it as a wishlist plugin for Rhythmbox?
