

GRUB problem?

Source: <http://linux.derkeiler.com/Mailing-Lists/Debian/2006-12/msg03118.html>

Hi,

Here's a weird one... I've noticed that as soon as the GRUB boot-loader runs, I lose my DVD-RW drive. It functions normally if I jump into the BIOS setup at boot time, then ceases to respond the moment GRUB runs, so that even if I boot into WinXP, the drive does not show up. Restoring the MBR makes the problem go away, so it is definitely not a drive problem.

I can't see anything specifically about this at the GNU GRUB home page. Anyone have any ideas, please?

Thx,
klw
