Hi,

I'm looking for a music player in Debian with some features, I did not yet find in the ones I tried (alsaplayer, beep, mp3blaster, quodlibet, rhythmbox, zinf). I did not try banshee ("55.2 MB of additional disk space will be used") nor amarok ("124MB..."). What I would like to see:

- most important: changing the speed without changing the pitch
- using a second output or sound card for "pre-listening"
- cross-fading
- search by artist/title/genre and by ranking
- nice to have: keeping track of intro/extro sequences
- UI: GTK+ or plain terminal preferred

Things I do not care about:

- any other media than locally stored OGG/MP3 files
- mobile music player devices

Is there such a program in Debian or at least in the free software universe? Many thanks in advance!

I would suggest giving Ableton a call and asking them to port Live! to Linux :-)

This is an interesting thread, and could I ask that you report back with your "final solution" when you get there.
