Thanks to all, I have learned a lot and took all the urls and suggestions.

I would like a .com direction or .net Not sure. Maybe .com because people remind it more easily.

I think I better contract for a service that gives domain and dns services all together, as you say.

I think I will contract it in a USA page if I can, as in Spain companies are for now not too "smart"

Did I tell you?

Mi provider took these time to do this:

- 85 days to give me the dsl router (and I asked for a 4 ports router, 2 ethernet, and they sent me a 2 ports one, 1 usb 1eth)
- 7 months to give me the static ip and full speed.

And the last one was because they created a false account, so I had to figure it out. When they said me, after 7 months, that there was "authentication errors", I just laughed and said them "you must have created some false account to me or are missing a password". And that was!

So I really prefer to go to another country for domain, as this seems the Stone Age with this, for the moment.

And I am not the only one, many people have similar problems. The companies just think in winning money!

Jordi
