Hello

Yesterday I was able to run my server. I have 2 computers at home, one is server and the other is not. Both are connected to router. One uses Xubuntu and the other Windows XP.

I know Xubuntu is not Debian but it is based on it. Few people in Xubuntu know how to do this, I asked, no solution was found to me.

What do you recommend me to send files between them? I mean, send files from the server to the other to save backups, and from the XP to the server to send files for anything.

To make a ftp server? Or what?  
Thanks again

If you are trying to use you xubuntu machine as a file-server for your windows machine... use Samba.

Find it in synaptic or aptitude.
