Is it possible to know why the reply-to field is not set to
debian-user@xxxxxxxxxxxxxxxxxxxx for each mail coming from the ML ? I am quite
sure you have discussed it before, but I am relatively new to this ML. When
you used not to take care about replying -it is the case in lots of ml, e.g.
gentoo'- it is very disappointing to see your replies to be sent out to the
last sender and not the whole list.

Thks for your answer.

I haven't been through it carefully, but this is what people bring up.
