I'm thinking of trying LVM on one of my Etch machines and I look for packages in the Etch repository. I see clvm, lvm-common, lvm2, and the virtual package, lvm-binaries. Looks easy, but the text description for lvm-common contains the following:

<quote> ... You need to install in addition one of lvm5, lvm6, or lvm10.
</quote>

There are no such packages in the repository. I suppose lvm2 is the successor to all these packages, and the description is simply out of date, but I'd like confirmation before I do something the might turn out to be a big mistake.

```
$ COLUMNS=200 dpkg -l |grep -i lvm
ii lvm-common 1.5.20 The Logical Volume Manager for Linux (common files)
ii lvm2 2.02.06-4 The Linux Logical Volume Manager
```

Everything works like a charm here. If you install lvm2, it will pull in lvm-common as a dependency.
