I think he said Celeron (doesn't that mean slow as celery, i.e. low-power?), 256 MB and no swap.

Modern Celerons (I have one, but nothing else modern to compare it to), i.e. the Celeron M, are apparently exactly the same as their Pentium M brethren (but not, I guess, the various Cores) except for a) smaller cache and b) reduced power saving functionality (IIUC, they're the identical chips with those two features disabled).
