Michael Fothergill wrote:

Dear Debianists,

What is the difference between libktable-dev in Ubuntu and tktable-dev in Debian? Are they pretty much the same package but with a name change or is there something more subtle going on here?

I can't seem to find libktable-dev in the Debian package world.

You can use `aptitude show <package>` to have more information for a package.

So, you will have the difference between these packages.
