OK, here's a narrowed down clue. This happens only when the "File System" option is involved. When I do Edit->Preferences and choose "File System" as the default save location, it just hangs in a similar fashion. And my default save location happens to be "File Systems", so it's hanging there (consistent with the earlier observation).

And even further, if the default selection on the left is my home directory, the moment I type "/" in the file name bar, it repeats the hanging business.

Further hints?

Thanks in advance.

Kumar
