Hi dear Mr/Mrs,

Several days ago, I succeeded download the DVD version of DVD intel x86 for Debian Linux and when I wanted to install Linux during the process of installation I got the problems.

The DVD RW isn't able to be detected. So, from the first step I could not pass this step that my DVDRW is not detected (I don't know whether it isn't mounted or not, because I am blank of Linux) I also don't know whether the DVD RW is non-IDE or non-SCSI CDRom drive or not.

I use Laptop LG E-50 Intel Core Duo T7100 (1.8 GHz), 2048 MB, 160 GB.

I have no idea how to load module and the device to use it. Module manual of CDROM that I read (such as aztcd,cdrom, cdu31a, cm206, gscd, gscd, isp16, mcdx, optcd, sbpcd, jscd, sonycd535) are not suitable to mount and detect my DVDRW for continuing installation the Linux.

even in /dev/ I don't find any hda, hdb, hdc or cdrom... I found ptyp0 - ptypf, ram0 - ram15, psaux, ppp, null, vcs1-vcsa5, etc

I have read the manual, but I found nothing to solve this problem. Please help me for solving this matter.

Sincerely yours,
Eric Jansen

You might want to check your bios and change your disk access to compatability mode.
