running Debian Etch. I have an HP slimline 3120 (AMD Athlon(tm) 64 X2 Dual Core Processor 4200+) with an MCP51 chipset providing HDA sound.

sound quibble:

- when I plug my speakers into 'front' speaker jack (green in the pack) I only get a mono signal, and output only on the right channel.
- if I plug into the jack for these 2.1 speakers into the earphone jack, and I get stereo. but the balance doesn't work.

MCP51 audio seems to be a major pain. For example, google "MCP51 alsa"

And here is a 13 page thread spanning over a year on the problem:

<http://ubuntuforums.org/showthread.php?t=239995>

Tuner card:

- There is a tv tuner in the PCI slot. I think it is this thing (from lspci -v)

```
02:09.0 Multimedia controller: Unknown device 1745:2100
Subsystem: ASUSTeK Computer Inc. Unknown device 48a3
Flags: bus master, medium devsel, latency 32, IRQ 11
Memory at fde00000 (32-bit, prefetchable) [size=1M]
Memory at fdbe0000 (32-bit, non-prefetchable) [size=64K]
Capabilities: [40] Power Management version 2
```

Any idea how to get video4linux to recognize it, so that I can have mythtv use it?

After much googling, it seems to be a ViXS (1745) PureTV-U (2100) device aka ViXS XCode 2100. I am seeing very little info on it at all and basically

Re: multimedia driver support questions...

nothing linux related. Don't get you hopes up.

Multimedia card reader:

There is one on the front of the case, but I can see nothing in lspci or lsusb which would indicate what device this is. It doesn't work.

Can you look inside and see what kind cable it uses (USB, IDE, SATA)?

Definitely not a computer designed with Linux in mind.  
Sorry I can't help more.

Cheers,  
Kelly Clowers
